

MEASUREMENT REPORT

Matching Accuracy

Measured against 237 real profiles, and proven in live use

Every figure here was produced by re-running the live matching engine over the **237 genuine LinkedIn profiles the system has collected** — real auditors, real finance managers, real employers. Nothing is estimated or projected.

Since the last edition the engine has also been **proven end to end on a live search**: six external auditors at EY, KPMG and Deloitte, ranked, returned to a recruiter. That run is the section this report was previously missing.

VERDICT

The engine performs well on everything measurable, and it has now been demonstrated on a real search rather than only on the archive. A recruiter asked for external audit managers at the Big Four and received six — all genuinely at those firms, all genuinely auditors, ranked by how well their career fits.

What "accuracy" means here — and what it does not

There is still no single accuracy percentage, and any report quoting one would be inventing it. A percentage needs an answer key: a sample of candidates marked *would interview* or *would not* by a recruiter. That exercise has not been done, and the final section sets out the hour of work it would take.

What can be measured, and is measured here:

- **Does it reject candidates in the wrong profession?** Checkable: read the job history.
- **Does the employer filter hold?** Checkable: read the employer.
- **Does the ranking put the right people first?** Partly — and this is where three defects were found.
- **Does it work on a real search?** Now answered.

The live search

A recruiter searched for *external audit manager*, restricted to the Big Four, requiring a professional qualification and five years' experience. Ten profiles were reviewed. Six were returned:

rank	score	name	title	employer
1	100	Hisham Sabry, ACCA, ESAA	Audit Manager	EY
2	100	Marwan Mohamed, CPA	Audit Manager	KPMG
3	95	Mohamed Fathy Bakr, ACCA, FESAA	Audit Manager	EY
4	92	Mohamed Elsherif, ACCA, CA, DipIFR	Audit Manager	EY
5	92	Belal Mansour, ESAA, DipIFR	Assistant Manager	Deloitte
6	85	Nancy Hamdy, ACCA	Audit Manager	EY

Every fix this engine has had is visible in those six rows:

WHAT THE SHORTLIST SHOWS	WHY IT MATTERS
All six are at Big Four firms	The employer constraint held, end to end.
Not one job title says "external"	At an audit firm the statutory work is titled simply "Audit". An earlier version demanded the literal word and discarded all six.
Five of six hold no CPA	They hold ACCA, ESAA, DipIFR — the qualifications this market actually uses. Requiring the American credential would have returned one person.
Four carry the credential in their name	"Hisham Sabry, ACCA, ESAA" is how this market presents itself. Reading only the skills list missed them.

THE CANDIDATE WORTH POINTING AT

Mohamed Fathy Bakr at EY, now rank 3, is the same person an earlier diagnostic showed being rejected for a single reason: *"Missing critical skills: CPA"*. He is an Audit Manager at EY holding ACCA and FESAA. He was never a poor match; the filter was asking the wrong question.

The archive measurement

The profession filter

The original complaint was concrete: *external audit manager* returned Finance Managers, because both titles share the word "manager". That is not a partial match — it is a different job. The engine now separates **what the job is** from **how senior it is**, and treats the profession as a gate.

SEARCH	BEFORE	NOW	REJECTED
external audit manager	237	72	70%
financial reporting supervisor	237	49	79%
finance manager	237	91	62%

The most specific request cuts hardest and the broadest cuts least. That pattern is the evidence the gate discriminates rather than simply rejecting.

The Big Four guarantee

When those firms are selected the requirement is absolute, and it is enforced twice: once through LinkedIn's own filter, and again after each profile is opened — so it holds even if the browser automation fails entirely.

FIRM	RETURNED	CORRECT
PwC / PwC Middle East	13	YES
EY	7	YES
Deloitte	7	YES
KPMG (Egypt, Saudi Arabia, Lower Gulf)	6	YES
Total	33	33 / 33

What the market actually holds

Counted across all 237 profiles. This is the single most useful thing in this report for briefing recruiters:

QUALIFICATION	HOLDERS	NOTE
CPA	42 (17%)	American
ACCA	21 (8%)	British — dominant in Egypt and the Gulf
DipIFR	16 (6%)	
CIA	8 (3%)	Internal audit
ESAA	5 (2%)	Egyptian Society of Accountants & Auditors
CPA or ACCA or ESAA	60	43% more than CPA alone

A search can now ask for any of several qualifications in one requirement — CPA / ACCA / ESAA — because requiring all three, which is what separate entries mean, matches nobody.

Three defects found by measuring

All three are recorded rather than quietly corrected. A measurement report that only reports good news is not a measurement.

1. A self-declared skill could satisfy the job requirement

Six of 39 candidates cleared the profession gate on a LinkedIn *skill tag* reading "External Audit", with no supporting job history — among them a Finance Manager and a Head of Finance. A tag costs nothing to add. Skills are now excluded from the gate and kept for keyword matching, where self-declaration is fair evidence. **Result: 6 → 0.**

2. Internal auditors outranked external ones

A candidate with five internal audit roles and one external role from early in his career scored **100, joint first**, above people doing external audit at PwC today. Depth credited a role for matching *any* word of the request, so "audit" matched all five internal roles in full while "external" counted for nothing. Each role is now credited by the share of the request it evidences. **He moved to 79.2, thirteenth.**

3. Audit managers at the Big Four were discarded entirely

The most serious, and it surfaced only when each claim in this report was tested individually. A search for *external audit manager* was rejecting Audit Managers at KPMG, PwC, EY and Deloitte — **28 people at the exact firms the recruiter asked for**. The cause is a fact about the profession, not a coding error: at an audit firm the statutory work is called "Audit", and only people distinguishing themselves from internal auditors write "external".

RESULT

An unqualified audit or assurance role now reads as external audit unless the career says "internal" — which internal auditors do say, every time, because theirs is the variant needing a label. **Big Four candidates went from 16 to 33**, spread across all four firms instead of 11 from a single PwC office. Internal auditors with no external experience are still rejected; that was re-verified, not assumed.

VERIFICATION

All three fixes live in one file, `job_titles.py`, covered by automated checks that pin these exact cases — including the internal-audit rejections, so the gate cannot be loosened later without a test failing. Suite: **419 passing**.

What is still not proven

POINT	STATUS
No labelled benchmark	Nobody has marked candidates <i>would interview / would not</i> , so there is no single defensible accuracy percentage — only the specific results here.
One live search, not sustained use	The pipeline is proven to work. It is not yet proven to keep working across weeks of real recruiting.
The automatic employer filter	The live search used company ids pasted from a LinkedIn URL, which is reliable and takes ten seconds. Driving LinkedIn's filter panel automatically is still unproven — and when it fails the app now says so plainly rather than returning an unfiltered list.

How to turn this into a real percentage

Take **50 candidates** from the 237 already collected. Mark each one *would interview or would not* — no scoring, no notes. About an hour of a recruiter's time.

With that answer key, precision becomes measured rather than asserted: *of the candidates the system put in front of you, X% were ones you would actually contact*. That figure holds up under questioning, can be re-run after every change to prove the system improved rather than merely changed, and is the only form of this number worth showing a stakeholder.

Figures computed on 14 August 2026 by re-running the production scoring and filtering code over the 237 profiles in the application database, plus one live LinkedIn search. Test suite: 419 automated checks passing. No figure in this document is estimated or projected.
